

Retail investors need portfolio updates where they already chat.

Current pain points

- Portfolio checks require opening broker apps repeatedly.
- Price alerts and summaries are scattered across apps.
- New investors want guidance without accidental real trades.
- Long conversations lose context across sessions.

Phase 1 goal: prove a WhatsApp-first assistant can connect messaging, broker data, memory, and safe workflows.

Show my portfolio

Your Zerodha account is linked, but there are no holdings available right now.

My name is John

Got it. I will call you John.

What is my name?

Your name is John.

A WhatsApp bot that connects to Zerodha and manages portfolio conversations.

Built as a queue-first assistant with memory, broker context, and guardrails.

WhatsApp	Meta Cloud API for inbound and outbound messages.
FastAPI	Webhook verification, message parsing, and job enqueueing.
Redis + ARQ	Background processing for LLM, broker, and alert jobs.
Supabase	Postgres storage for users, memory, broker tokens, alerts, and audit events.
Zerodha	Kite Connect for account linking, holdings, and portfolio sync.
LangChain + Ollama	gpt-oss:120b-cloud for intent, chat, and summaries.

Guardrail design

No direct advice The assistant avoids personalized buy/sell recommendations.	Backend truth Portfolio facts come from Supabase and Zerodha, not memory guesses.
Paper trading Buy/sell flows require confirmation and do not place real orders.	Context memory Recent messages plus long summaries keep conversations coherent.

Designed for Indian retail investors who want a low-friction portfolio companion.

Ideal customer

Beginner and intermediate Indian retail investors who use WhatsApp daily and want faster portfolio awareness.

Primary use cases

Portfolio summary, linked-account status, price alerts, name/profile memory, and paper-trade confirmation.

Why now

Messaging-first workflows plus LLM memory make portfolio tools simpler and more accessible.

Phase 1 deliverables completed

- Working MVP demo on WhatsApp.
- Zerodha account linking and portfolio sync.
- Clear product journey and technical stack.

Next build milestones

- Production deployment instead of ngrok.
- User-facing Zerodha connect link in chat.
- Richer alert UX and portfolio insights.
