

Retail investors need portfolio updates where they already chat.

Current pain points

- Portfolio checks require opening broker apps repeatedly.
- Price alerts and summaries are scattered across apps.
- New investors want guidance without accidental real trades.
- Long conversations lose context across sessions.

Phase 1 goal: prove a WhatsApp-first assistant can connect messaging, broker data, memory, and safe workflows.

hi

Welcome. Please review Privacy and Terms, then reply AGREE to continue.

AGREE

Thanks. Next, connect Zerodha securely through the official login link.

/search latest news about INFY

Here are recent sources I found. This is informational only, not investment advice.

A WhatsApp bot that connects to Zerodha and manages portfolio conversations.

Built as a deployed assistant with memory, broker context, and guardrails.

WhatsApp	Meta Cloud API for inbound and outbound messages.
FastAPI	Webhook verification, message parsing, legal pages, and Zerodha callback.
Render	Single free web service using QUEUE_MODE=inline for the MVP demo.
cron-job.org	Scheduled HTTP trigger checks saved alerts every few minutes.
Supabase	Postgres storage for users, memory, broker tokens, alerts, and audit events.
Zerodha	Kite Connect login, holdings, and quote-gated LTP prices.
LLM + Web Search	OpenRouter handles chat and intent; Tavily adds sourced current info.

Guardrail design

No direct advice The assistant avoids personalized buy/sell recommendations.	Backend truth LLM receives cleaned context and uses links for searched public facts.
Paper trading Buy/sell flows require confirmation and do not place real orders.	Context memory Recent messages plus durable summaries keep long conversations coherent.

Designed for Indian retail investors who want a low-friction portfolio companion.

Ideal customer

Beginner and intermediate Indian retail investors who use WhatsApp daily and want faster portfolio awareness.

Primary use cases

Consent onboarding, Zerodha connect, portfolio summary, saved price alerts, source-backed search, profile memory, and paper-trade confirmation.

Why now

Messaging-first workflows plus LLM memory make portfolio tools simpler and more accessible.

Phase 1 deliverables completed

- Deployed WhatsApp bot on Render.
- Consent flow and Zerodha connect link working.
- Tavily web search and scheduled alert checker configured.

Next build milestones

- Zerodha quote permission for live alert triggers.
- Multi-intent handling and richer portfolio insights.
- Real WhatsApp Business number after prototype validation.
